

Explicit motion task: local agents and conventional methods

18 observations / 12 independent experiment groups per repeat · synthetic development only

Same public scientific rules and equal maximum budgets for local direct/tool modes; every assigned attempt retained.

A/B: higher counts are desirable. C: lower is desirable, but failures and abstention can lower this count; inspect A and D too.

D counts required ambiguous answers recovered, with its eligible denominator printed. Repeats do not create new independent cases.

Exact descriptive counts; no sampling confidence intervals. Contract correctness is conditional on supplied diagnostic assumptions.

Direct mode has no structured interval field; these are decision comparisons, not a fair numerical-reconstruction comparison.
