

Motion and diagnostic drift: coverage and false confidence

Synthetic development · 216 observations / 144 independent experiment groups

Fixed 100 ns displacement window · 10 nm decision resolution · truth is exact only within this simulator

● Naive ■ Bounded uncertainty

Counts label every point. Coverage excludes cases with no finite interval; missing coverage is not plotted as zero.

Gray row: structurally ambiguous information. Peach rows: undeclared model mismatch. Zero wrong decisions may reflect abstention.

*95% refers to the Gaussian component, conditional on supplied noise and nuisance bounds. Enlarged sets may be conservative.

Descriptive paired-case proportions; no sampling confidence intervals shown. The ambiguous and calibrated-reference tracks share experiment groups.
